Diagnostics

Configurations · https://codifycore.com/docs/diagnostics/

What this does

Diagnostics provide a set of real-time testing tools built directly into the WordPress admin area. It allows you to fire sample payloads manually to verify your connection endpoints (like your sGTM Server URL or Meta CAPI). This confirms that your server can successfully reach the tracking destinations and that your authentication credentials (like GA4 API secrets or CAPI tokens) are valid, all without needing to perform actual test checkouts on the frontend.

How to configure

1. Navigate to your WordPress admin dashboard.
2. Go to **FluentCart > CodifyCore sGTM**.
3. Open the **Diagnostics** tab.
4. Select the specific connection test you wish to run (e.g., Test sGTM Connection, Test Meta CAPI Connection).
5. Click the button to dispatch the test payload.
6. Review the on-screen response results to confirm success or identify connection errors.

Dependencies

- **FluentCart** plugin must be installed and active.
- **CodifyCore sGTM for FluentCart** (Free) plugin must be installed and active.
- **CodifyCore sGTM for FluentCart Pro** extension must be installed, active, and licensed.
- GTM Integration or Direct Meta CAPI must be configured with endpoints/credentials prior to testing.
