Event Logs

Configurations · https://codifycore.com/docs/event-logs/

What this does

Event Logs provide a historical record of all internal server-side event dispatches generated by the plugin. It stores and displays the full payload data and the corresponding API responses from your tracking endpoints (like sGTM or Meta CAPI). This feature is vital for monitoring the health of your tracking system, confirming that payloads contain the correct hashed data, and troubleshooting failed network requests. The system automatically cleans up older logs via a scheduled daily process to maintain database performance.

How to configure

1. Navigate to your WordPress admin dashboard.
2. Go to **FluentCart > CodifyCore sGTM**.
3. Open the **Logs** tab.
4. Review the chronological list of event dispatches.
5. You can click on individual log entries to expand and inspect the detailed payload JSON and the server response code.
6. (No direct configuration is required to start logging; it is active automatically when the Pro plugin is enabled).

Dependencies

- **FluentCart** plugin must be installed and active.
- **CodifyCore sGTM for FluentCart** (Free) plugin must be installed and active.
- **CodifyCore sGTM for FluentCart Pro** extension must be installed, active, and licensed.
